

Smart Grocery Cart Assistant

*Built on top of the JioMart Retail Product Catalog, [sourced]
(<https://www.kaggle.com/datasets/satyamsundaram/jiomart-products-dataset>) from
Kaggle*

Objective

Create a Gradio-based AI assistant that recommends a weekly grocery shopping cart based on the user's dietary needs and preferences. The app uses Retrieval-Augmented Generation (RAG) on a structured JioMart product dataset, generating explainable, structured results that are visually rendered like a real shopping cart.

Part 1 — User App (Essential Features)

Inputs

- **Grocery Needs:** Free-form text input
(e.g., "high protein, no besan or curd")

Output

- **Suggestion:** A natural language explanation of what's recommended and why
- **Shopping Cart:** Structured as a visual gallery containing:
 - Product Name
 - Quantity
 - Price
 - Product Image

Part 2 — Visual Experience

Visual Cart (Gradio `gr.Gallery`)

The cart is rendered in a grid format using `gr.Gallery` , where each item includes:

- Product image (`image_url`)
- Caption text with:
 - `item_name`
 - `Qty.{quantity}`
 - `₹total_price`

This provides a realistic and user-friendly shopping experience.

Part 3 — Developer-Facing Advanced Settings

Shown under a collapsible **LLM Settings (Advanced)** section in the UI.

Model & Generation Settings

- **Model Selector** (+additional 2 models from Groq after looking at benchmarks and other things):
 - LLaMA 3.3 70B (`llama-3.3-70b-versatile`)
- **Temperature Slider**: Adjustable between 0.0 and 1.5

These settings allow developers to tune how deterministic or creative the model's responses are.

Backend Setup

Vector Store and RAG

- **Embedding Model:** LLaMA 3.2 (3B) via Ollama
- **Vector Database:** ChromaDB
- **RAG Workflow:**
 1. Load product catalog using `CSVLoader`
 2. Parse and clean fields into `Document` objects with metadata
 3. Generate embeddings and index documents
 4. Perform similarity search based on user preferences
 5. Use an LLM to generate structured output parsed via `PydanticOutputParser`

Sample CSV Schema Mapping

Field in CSV	Mapped Use
title	item_name and quantity (parsed from name)
discountedPrice	unit_price
filename	image_url
subType	sub_category
type	category

Advanced:

Developer features:

- Chunk Size, Chunk Overlap
- Top K (similarity search)
- MMR, Hybrid search

User-features:

- Budget constraints (given a budget, do this for me)
- Integrate with diet plan for 1 week, and ingredients needed

Considerations

The user prefers high-protein foods. Among the retrieved items, the Moong Bhajiya Pakodi Flour is made from moong lentils, which are protein-rich, making it the best match. Uttam Wheat's Daliya provides some protein as well and can complement the selection.
